

Snapshot Objectives For EagleNav

Members of CS 3338-02 Spring '26 Group 5 @ CSULA

May 2026

0.1 Disclaimer

This document does not represent the snapshot objectives of the actual EagleNav project. Rather, this is a *hypothetical* document for CS 3338-02 Spring '26's final project.

1 Introduction

EagleNav is a mobile application designed to help users navigate the CSULA campus using augmented reality. The system provides visual directions, voice guidance, and basic navigation support to improve accessibility and ease of movement across campus.

To ensure that EagleNav meets the requirements outlined in the Software Requirements Specification (SRS), we have created snapshot objectives that the project is expected to meet. This document contains these snapshot objectives, with each snapshot consisting of criterion that helps validate that software both meets specifications and that implementation as described in the Software Design Document (SDD) works. These can range from core-functionalities, to niche/obscure features.

2 Snapshot 1

- Define requirements for the project and outline those in the SRS, along with legal and ethical considerations.
- Create the Software Design Documents + other associated design assets.

3 Snapshot 2

- Build core features, including map navigation
- Implement initial User Interface (UI)

4 Snapshot 3

- Add AR and voice navigation features
- Add rough API implementation
- Improve robustness of system
- Improve UI visuals and add corresponding UI to reflect new features.

5 Snapshot 4

- Complete external API support
- Finalize project
- Testing and fixes

6 Conclusion

The snapshot objectives outline the main stages of development for EagleNav. Completing each snapshot ensures that the system is properly designed, implemented, and tested before final delivery.
